

Injection Performances - Peak Modulation service

Injection capacity for the Peak Modulation service or PI_{MODP}

Under the assumption that storage space made available to Users in T.Y. 2018/2019 is completely emptied, Edison Stoccaggio defines the Injection capacity for the modulation peak service (PI_{MODP}), expressed in kWh/d, that the User can utilize in every Gas-Day during the contractual period.

During the Injection Period, the PI_{mod} is defined on the basis of the overall injection curve of the hub storage, reprocessed through the definition of the intervals and relevant coefficients, in order to take into account the actual volumes injected in the storage by the User.

In accordance with the art 14.3 of the deliberation 119/05, with the aim to guarantee the adequate flexibility to the User during the Injection Period, Edison Stoccaggio determines the minimum and maximum stock allowed to the User at the end of every month of such period, with reference to the capacity assigned to the User.

Injection Performance ($PI_{MODP} = c \times CI_{MODP}$) valid during the Injection period are set here below, while the value of PI_{MODP} during Withdrawal Period is equal to 5,000,000 kWh/d:

$\leq INV\%$		c	PI_{MODP}	c1	c2	c3
0,00%	76,00%	1	68,530,000	0.21	0.425	0.373
76,00%	100%	0.85	58,250,500			

Coefficient c1 is applied to the period 1st-9th April

Coefficient c2 is applied to the period 10th-19th April

Coefficient c3 is applied to the period 1st-20th October
